

01 · The Offer

Positioning

MMFX is infrastructure for forex IBs.

Not an agency on retainer, and not a franchise. MMFX supplies the platform, the product suite and the funnel that turn an IB with an audience into an IB with something to sell — under the IB's own brand, on the IB's own domain.

The closest analogue outside this industry is Shopify. Shopify does not sell products and does not compete with its merchants for brand equity; it makes it possible for them to have a store at all. MMFX proposes the same relationship with Dupoin's IB network.

This matters commercially: **MMFX does not compete with Dupoin's IBs for their audience or their brand.** Every trader acquired stays visibly the IB's trader, on the IB's desk, and funds a Dupoin account. MMFX is invisible to the end trader by design.

How value is actually created

Every service in this pack is judged against one equation:

$$\text{Volume} = \text{funded accounts} \times \text{lots per account per month} \times \text{months the account stays alive}$$

|__ lead gen __| |__ product / engagement __| |__ retention __|

Most IB support programmes only address the first term. Referral links, banner sets, a landing page template. They increase how many accounts open. They do nothing about what happens next, which is where the volume actually is.

The third term is where MMFX is different. An IB with a desk gives their trader a reason to return daily: their trades imported automatically, their behavioural leaks quantified in dollars, a discipline score that moves, a coach that reviews their decisions against their own stated goals, indicators live on their charts, a calendar telling them what is about to move gold. That trader stays funded longer and trades more. A trader with a referral link and nothing else churns.

This is the entire argument for an override rather than a flat fee. MMFX is paid on volume because MMFX's product is what produces the volume — not just the introduction.

Illustrative economics

Placeholder figures, to be replaced with whatever rate Dupoin proposes:

Input	Assumption
Sub-IBs on the platform	20
Funded traders per IB	50
Lots per funded trader per month	5
Override	\$2 / lot
Monthly override	\$10,000

The purpose of this table is not to forecast. It is to establish the scale at which each tier below can cover its own cost base — particularly Tier 3, which carries real operating cost per IB.

| The three tiers

Tier 1 — Equip

No fee, no subscription. The default.

The complete white-labelled desk: the full tool suite, the short foundation course, the signup-to-funded funnel, lifecycle email, analytics, and the studio for uploading their own content. Their brand, their domain, their traders.

The IB writes no cheque — no setup fee, no monthly fee. MMFX is compensated out of the per-lot pool, so the arrangement is funded by volume rather than by the IB. This should be close to frictionless to accept: an IB with an audience and no product gets one without a cash outlay, and MMFX only earns if their traders actually trade.

Tier 2 — Equip + Capture

Tier 1 plus the acquisition layer.

Their own landing pages, conversion tracking with a creative-ID convention that ties spend to funded accounts, lifecycle email sequences, and a lead dashboard. For IBs who are already driving traffic and are losing it through a weak capture layer.

Small per-IB build. Suits IBs with an existing audience and no funnel.

Tier 3 — Full agency

Tier 2 plus MMFX runs the paid media.

Meta and short-form campaign build and management, the full creative production line, geo tiering, and creative refresh on a cadence. This is a genuine agency service and carries genuine cost.

Ad spend is funded by the IB or co-funded by Dupoin — never by MMFX. The override is paid after volume is generated; advertising is paid weeks before. See [05-COMMERCIAL](#), condition 2. This is the tier where the arrangement either compounds or bleeds, and it should be entered deliberately, with a small number of IBs, once Tier 1 has proven out.
