

03 • Landing Pages & Tracking

This is the operational file. Everything here is already built and live in production — please use it as specified so attribution works end to end.

1. The landing pages

Eleven purpose-built landing pages exist for paid traffic. They are **message-matched** to a single feature/hook and **noindex** (paid destinations only, not organic).

Base URL pattern: `https://marketmakersfx.net/lp/{slug}`

Slug	Headline (the hook the LP delivers on)
<code>ai-trading-assistant</code>	<i>You don't have a strategy problem. Nobody's keeping score. ★</i>
<code>know-your-style</code>	<i>Fourteen questions. Then you'll know why your style keeps failing. ★</i>
<code>daily-analysis</code>	<i>Every session, the gold read — before you risk a thing.</i>
<code>mm-system</code>	<i>The exact system. Basic to institutional, in 19 lessons.</i>
<code>fundamental-desk</code>	<i>Know which way gold is leaning before you take the trade.</i>
<code>analysis-bots</code>	<i>Two bots: one reads the macro, one reads you.</i>
<code>live-classes</code>	<i>Twice a week, live on the charts, with the desk.</i>
<code>ebook-library</code>	<i>The whole system, on paper. Four books you'll re-read.</i>
<code>indicators</code>	<i>Drop your TradingView name. Ten indicators appear.</i>
<code>strategies</code>	<i>Backtest the exact entry model — on your own charts.</i>
<code>signals</code> ⚠	<i>A few gold calls a day. Entry, stop, target. — see compliance</i>

★ = our recommended starting points (see §6).

Supporting pages (organic/reference — usable but not optimised for ads)

- `https://marketmakersfx.net/` — home
- `https://marketmakersfx.net/features` — all features, and `/features/{slug}` (11 pages — the organic/SEO equivalents of the LPs above)
- `https://marketmakersfx.net/how-it-works` · `/faq`
- `https://marketmakersfx.net/legal/risk-disclosure` · `/legal/terms` · `/legal/privacy`

⚠️ **Never send paid traffic directly to `app.marketmakersfx.net`**. The app is the logged-in product. The `/lp/` pages set the attribution cookie that the server-side conversion events depend on — bypassing them breaks measurement.

2. URL structure — use exactly this

```
https://marketmakersfx.net/lp/{slug}
?cid={CREATIVE_ID}
&geo={COUNTRY}
&offer={OFFER}
&utm_source=meta
&utm_medium=paid
&utm_campaign={CAMPAIGN}
&utm_content={AD_SET_OR_AD}
```

The parameters we read

Param	Purpose	Values
<code>cid</code>	Creative ID — ties an individual creative to signups and funded members in our analytics	See §3
<code>geo</code>	Country, so the LP and offer routing match	<code>SG</code> , <code>MY</code> , <code>ID</code> , <code>NG</code> , <code>ZA</code> , <code>IN</code> , <code>AE</code> , ... (ISO-2)
<code>offer</code>	Which offer the ad promised	<code>TRIAL</code> (default) · <code>LIFETIME</code> (US/UK only)
<code>utm_*</code>	Standard analytics	<code>utm_source=meta</code> , <code>utm_medium=paid</code> , plus campaign/content

All of these are captured on the LP, carried into the signup URL, and stored in a cross-domain cookie for 7 days, so a signup that happens after the click still attributes to the right ad.

Working example

```
https://marketmakersfx.net/lp/ai-trading-assistant?cid=CRT-0917-AITA-SCORE-
V1&geo=SG&offer=TRIAL&utm_source=meta&utm_medium=paid&utm_campaign=aita_prospecting_sg&utm_c
ontent=score_hook_v1
```

Meta's `fbclid` is appended automatically — **do not strip it**. We use it server-side to rebuild Meta's click identifier for conversion matching.

3. Creative ID (`cid`) convention

This is how we attribute revenue to a specific creative. Please follow it.

CRT-{MMDD}-{FEATURE}-{HOOK}-{VARIANT}

Part	Meaning	Example
CRT	fixed prefix	CRT
MMDD	creative launch date	0917
FEATURE	which product	AITA , KYS , DAILY , COURSE , FUND , CLASSES , EBOOK , BOTS , IND , STRAT , SIGNALS
HOOK	the angle	SCORE , LEAK , BLOWUP , QUIZ
VARIANT	version	V1 , V2 , I1 (image), B1 (body copy variant)

Example: CRT-0917-AITA-LEAK-V2

Keep **cid** **identical** to the creative filename where possible (see 04-CREATIVE-ASSETS.md) so a creative can be traced from file → ad → signup → funded member.

4. What's already installed

Layer	Status	Notes
Meta Pixel	✓ Live on all LPs	PageView + events, each with a unique eventID
Meta CAPI (server-side)	✓ Live	Fires from our server; PII is SHA-256 hashed before sending
Event de-duplication	✓	Pixel and CAPI share an eventID , so events aren't double-counted
Click-ID matching	✓	fbclid captured and converted server-side for match quality
Cross-domain attribution	✓	Parent-domain cookie carries attribution marketmakersfx.net → app.marketmakersfx.net
Attribution window	7 days	Cookie lifetime
PostHog + Microsoft Clarity	✓ Live	Product analytics + session recordings on LPs

Pixel ID: ask Don — supplied separately, not in this pack. (The CAPI access token is a server secret and is never shared.)

5. Conversion events you can optimise for

Event	When it fires	Source	Latency
PageView	LP loads	Pixel	Instant
CompleteRegistration	User completes signup	CAPI	Instant
StartTrial	Same moment — the 7-day trial begins	CAPI	Instant
Purchase	A human verifies the member's broker deposit	CAPI	⚠️ Hours to days

⚠️ Critical: how Purchase actually behaves

Purchase is **not** an instant e-commerce checkout. The member funds a broker account, then **an admin manually verifies** it before the event fires. That means:

- It is **delayed** (hours, sometimes days) and **low-volume by nature**
- It will **never** feed the algorithm fast enough to be the day-one optimisation event

Recommended optimisation path:

1. Launch on **CompleteRegistration** (or **StartTrial** — they fire together). Fast, clean, high enough volume to exit learning.
2. Watch **Purchase** as the business KPI, not the optimisation target.
3. Only move to **Purchase** /value optimisation once weekly volume supports it — discuss with Don before switching.

Because the trial is **7 days**, expect roughly a **7-14 day lag** between spend and the funded conversions it produced. **Please don't judge campaigns on Purchase inside the first fortnight** — the data isn't in yet.

6. Where we suggest starting

Two strongest hooks:

1. **ai-trading-assistant** — the newest product and the sharpest emotional hook ("*nobody's keeping score*"). It's a genuine differentiator no competitor has, and it diagnoses the exact pain the audience feels.
2. **know-your-style** — a 14-question profiler. Quizzes are high-intent, interactive and self-revealing; historically the strongest top-of-funnel asset we have.

Then: **daily-analysis** (proof of consistent work) and **mm-system** (the "where do I start?" beginner angle).

Geography: start with the strongest existing base — **Singapore, Malaysia, Indonesia** — then test Nigeria/South Africa/India. **Do not run the standard trial offer in US/UK** (different offer entirely — see **01-BUSINESS-BRIEF.md**).

7. Notes and limitations

- Every feature has a matching LP — all 11 are built, live and `noindex`.
- `signals` is our most compliance-sensitive surface. The LP itself is carefully worded ("teaching examples, not blind calls"). Read `05-COMPLIANCE.md` before proposing any signals-led creative, and never introduce accuracy, win-rate or profit language in the ad.
- `strategies` carries a **backtest disclaimer** on-page (historical and hypothetical, past performance ≠ future results). Ad copy must not undercut it by implying returns.
- **Attribution is 7 days**. A signup on day 8 after the click won't attribute. Worth knowing when reconciling numbers.

8. Reporting we'd like

- Spend, CPM, CTR, CPC by campaign / ad set / `cid`
- **Cost per CompleteRegistration** — the primary efficiency metric
- Creative-level performance keyed to `cid` so we can match it to funded members in our own analytics
- Flag any ad rejections or account warnings **immediately** — in a restricted category these compound quickly
